

Verzeichnis der tschechoslowakischen Laufkäfer
/ Coleoptera - Carabidae /
Jan Pulpán, Karel Hůrka

Das angegebene Verzeichnis der Taxa geht von der letzten Liste der Familie aus, die von Pulpán und Reška /1973/ publiziert wurde. Diese Liste hat die Zusammensetzung der tschechoslowakischen Laufkäferfauna, die von der grundlegenden Arbeit von Kult /1947/ ausgeht, sowie das Verzeichnis von Horion /1951/, nicht nur kritisch revidiert, sondern auch auf Grund der neuen faunistischen Angaben mancher Sammler ergänzt. Die Unterlage für die Angaben über die Tribus Carabini und Cychrini stellt die Bearbeitung von Niedl /1956-60/ dar. Der Einigkeit halber ist auch bei den Arten der Gattung Carabus L. nur die Unterart /subspecies/ als der niedrigste Taxon benutzt. Es sind also nicht einmal die microgeographischen Lokalrassen des Typus "natio", die sich in der Taxonomie der Gattung Carabus eingebürgert haben, angegeben.

In der Klassifikation der Unterfamilien, der Gattungen und der Untergattungen sind wir, einigermaßen modifiziert, aus Kryzhanovskij /1983, Fauna der Sowjetunion .../ ausgegangen. Einige nomenklatorische Auffassungen haben wir aus der Bearbeitung der Familie im Katalog Fauny Polski /1973, 1974/ übernommen. Die Taxonomie der Gattung Tachys Steph. wurde im Mitteleuropa bisher nicht gelöst. Aus diesem Grunde wird die Art T. caspius Kolenati, 1845 mit einem Fragezeichen angegeben. Auch der Status der Art T. micros Fisch. de Waldh., die sichtlich das Gemisch der Arten darstellt, braucht eine Revision.

Das Fragezeichen /?/ bei der Angabe des Landes bedeutet, dass die Autoren das Vorkommen der Art aus taxonomischen oder zoogeographischen Gründen bezweifeln. Die belegten Arten die mehr als 30 Jahre nicht gefunden wurden, werden mit /+ / bezeichnet; die bisher nicht gefundenen, wahrscheinlich aber auf dem Gebiet der ČSSR vorkommenden Arten, werden mit einem Punkt /./ bezeichnet.

In das Verzeichnis wurden nicht die Arten einbezogen, die ausgesprochen eingeschleppt wurden oder die sich sichtlich verfloren haben und deren Vorkommen auf dem Territorium der ČSSR aus zoogeographischen Gründen unwahrscheinlich ist: *Bembidion /Actedium/ pallidipenne* /Illiger, 1801/ - B; *Bembidion /Cillenus/ laterale* /Samouelle, 1818/ - B; *Bembidion /Talanus/ subfasciatum* Chaudoir, 1850 - M; *Carterophonus cordicollis* /Audinet-Serville, 1821/ - S; *Pterostichus /Heptoderus/ vecors* Tschitscherine, 1897 - M.

Insgesamt wurden auf dem Territorium der ČSSR 8 Arten der Unterfamilie Cicindelinae / Bohezia - 6, Mocravia - 8, Slovakia - 8/ und 544 Arten der Unterfamilien Omophroninae, Carabinae und Brachininae / Bohezia 412, Mocravia 462, Slovakia 522/ festgestellt. In diese Zahlen wurden die mit Fragezeichen angegebenen Arten nicht einbezogen.

B = Bohezia
M = Mocravia
S = Slovakia
